Introduction:

The BEST (Benguela Source and Transport) project was designed to investigate the transport of the Benguela Current and the ratio of the Agulhas Current and South Atlantic source water masses. The transport of the Benguela Current and its variability is measured using a moored array of instruments, analysis of the TOPEX/POSEIDON satellite altimeter data, and CTD density observations. The source of the water is determined by analysis of the water mass properties measured with a CTD.

To accomplish the BEST objectives, an extensive field program was carried out between June 1992 and November 1993. The field work consisted of three hydrographic surveys, and a moored array of inverted echo sounders (IES), inverted echo sounders with pressure gauges (PIES) and current meter moorings (CMM). The array was deployed in June 1992. During October and November 1993, 4 PIES and 4 current meter moorings (CMM) were recovered. See Garzoli et al. (1995c) and Pillsbury et al. (1995) for details of the IES and current meter programs. A more detailed description of the BEST program can be found in Garzoli et al. (1995a).

This report presents CTD and hydrographic data from the second hydrographic survey aboard RRS DISCOVERY, Voyage 202 (Cape Town to Cape Town, 7 May to 3 June 1993. A. L. Gordon, Chief Scientist). This cruise is the primary CTD component of the BEST project. There were two basic objectives of the hydrographic work. One, obtain CTD stations above the BEST moorings. These CTD stations provide a "snap-shot" view of the thermohaline and oxygen stratification to help interpret the moored array time series data. Two, gather hydrographic and dynamic data, and survey Agulhas eddies.

Data Collection and Processing:

Three instruments were used for data collection. A SeaBird Electronics Seacat 19-02, which will be referred to as SBE, and two Neil Brown Mark III instruments which will be referred to as 2052 and 2809. Table 1.1 shows which instruments were used for each station.

The instrument 2809 pressure sensor was calibrated in March 1993. The temperature sensor was calibrated in March 1993 and in November 1993. A temperature calibration value was calculated for each station by interpolating between the two calibrations. Instrument 2052 was calibrated in March 1993.

Instrument 2052 failed, so instrument 2809 was used for the majority of the cruise. The data collected with each instrument were calibrated independently. A pressure bias for 2809 was based on the pressure when the instrument entered the water. The calculated bias, 1.1 dbar, was added to the raw CTD pressure.

The conductivity was lagged to account for the time constant mismatch using a phase-lagging filter:

\[
Co_i = (1.0 - e^{-1/i})Co_i + e^{-1/i}Co_{i-1}
\]

TABLE 1.1:

| SBE, 2052, 2809 |
| 001, _ , _ |
A second order fit of the Delta Conductivity (DC)* versus Conductivity (CO) was used to correct the data. This was done using three sets of stations [21 - 29], [30 - 40], [41 - 72]. The station sets were chosen to minimize temporal effects. [* DC = CTD data - bottle data conductivity. The conductivity bottle data measurements were made using a guildline 8400A and ISO standard water from Ocean Scientific: batch number P120.]

After the resulting calibration coefficients were applied to the station sets, a bias was calculated for each station and applied to the raw CTD conductivity data. The CTD data within the bottle files was corrected and a new DC was calculated.

A second order fit of the bias corrected DC versus the bias corrected CO was obtained for stations [20 - 74]. The resulting coefficients were then applied to the data. Finally, a first order pressure component of conductivity was corrected for using a first order calibration fit of DC versus pressure. Figure 1.1 (Not included) is a histogram of the final CTD conductivity and rosette conductivity differences.

The data for stations 01-19, instrument 2052, were calibrated using the same methods as outlined above. The SBE data was then calibrated using the calibrated data from 2809. The calibrated SBE data was then compared to the calibrated data of the 2052 instrument. This was done to confirm the accuracy of instrument 2052 calibration. The difference between the SBE and 2052 is within the error of the instruments.

The oxygen data were calibrated after all other calibrations were applied. This was done implementing the methods outlined by Millard (1991).

Personnel involved in the collection of these data were:

Arnold L. Gordon  Principle Investigator  LDEO
Bruce Huber  Snr. Research Associate  LDEO
Philip Mele  Research Associate  LDEO
Marcela Stern  Electronic Technician  LDEO
Stewart Sutherland  Staff Scientist  LDEO
Anthony Martino  Research Assistant  LDEO
Deirdre Byrne  Graduate Research Assistant  LDEO
Paul Marchese  Graduate Research Assistant  LDEO
Steve Rock  Graduate Research Assistant  LDEO
Chris Duncombe Rae  Graduate Research Assistant  UCT;SFRI
Christine Illert  Technician  SFRI
Andrew N. Cormack  Computer Technician  NERC/RVS
Jeff L. Jones  Mechanic Technician  NERC/RVS
Richard A. Phipps  Mechanic Technician  NERC/RVS
Chris Rymer  Mechanic Technician  NERC/RVS
C. W. Woodley  Electronics Technician  NERC/RVS

LDEO - Lamont-Doherty Earth Observatory of Columbia University
UCT - University of Cape Town
SFRI - Sea Fisheries Research Institute, Cape Town
NERC/RVS  NERC Research Vessel Services

Acknowledgments:
The RRS Discovery is operated by the Natural Environment Research Council of Great Britain. We appreciate the service and dedication of the Discovery officers and crew, who helped make this a successful scientific mission. Funding for this cruise was provided by the National Science Foundation grants OCE 9102722 and OCE 9401950.

These data have been submitted to National Oceanographic data Center (NODC). There are also plans to make the data available via the Lamont-Doherty Earth Observatory Physical Oceanography Website. The LDEO URL is: http://www.ldgo.columbia.edu.

Report Format:

Header record:

SHIP     NODC Country/Ship code (74DS)
CRUISE   Originator's cruise number (202)
STA      Originator's station number
CAST     Originator's cast number
LAT      latitude in decimal degrees (minus = south)
LONG     longitude in decimal degrees (minus = west)
DATE     date reported as Year (YY), Month (MM) and Day (DD) GMT
YDAY     year day GMT
TIME     time reported as hour (HH), minute (MM) GMT
DEPTH    corrected depth to bottom (meters)

Data record:

PRESS CTD Pressure (dbar)
CTDTEMP  CTD Temperature (Celcius, IPTS-68)
CTDSAL   CTD Salinity (pss78)
BOT      Bottle Number
BOTSAL   Rosette Bottle Salinity (pss-78)
BOT_O2   Rosette Bottle Oxygen (ml/l
