

Re-Isolation of the azaspiracid producing dinoflagellate *Azadinium spinosum* from the Danish west coast

Bernd Krock, Urban Tillmann, Allan Cembella

Alfred Wegener Institute for Polar and Marine Research, Bremerhaven, Germany

Historic Background

Since 1995 new DSP-like poisoning events became public

MacMahon & Silke, 1996: Harmful Algae News, 14, 2

In 1998 Satake et al. identified azaspiracid-1 (AZA-1) as the causative compound in shellfish

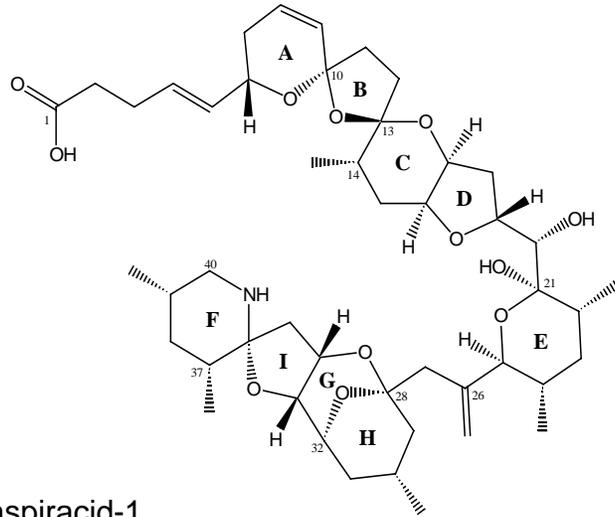

J. Am. Chem. Soc., 120, 9967-9968

In 2003 James et al. suggested the heterotroph dinoflagellate *Protoperidinium crassipes* as the AZP causing organism

Toxicon, 41, 277-283

To date more than 30 structural azaspiracid variants are known

Rehmann et al. (2008) Rapid Commun. Mass Spectrom., 22, 549-558

Azaspiracid-1

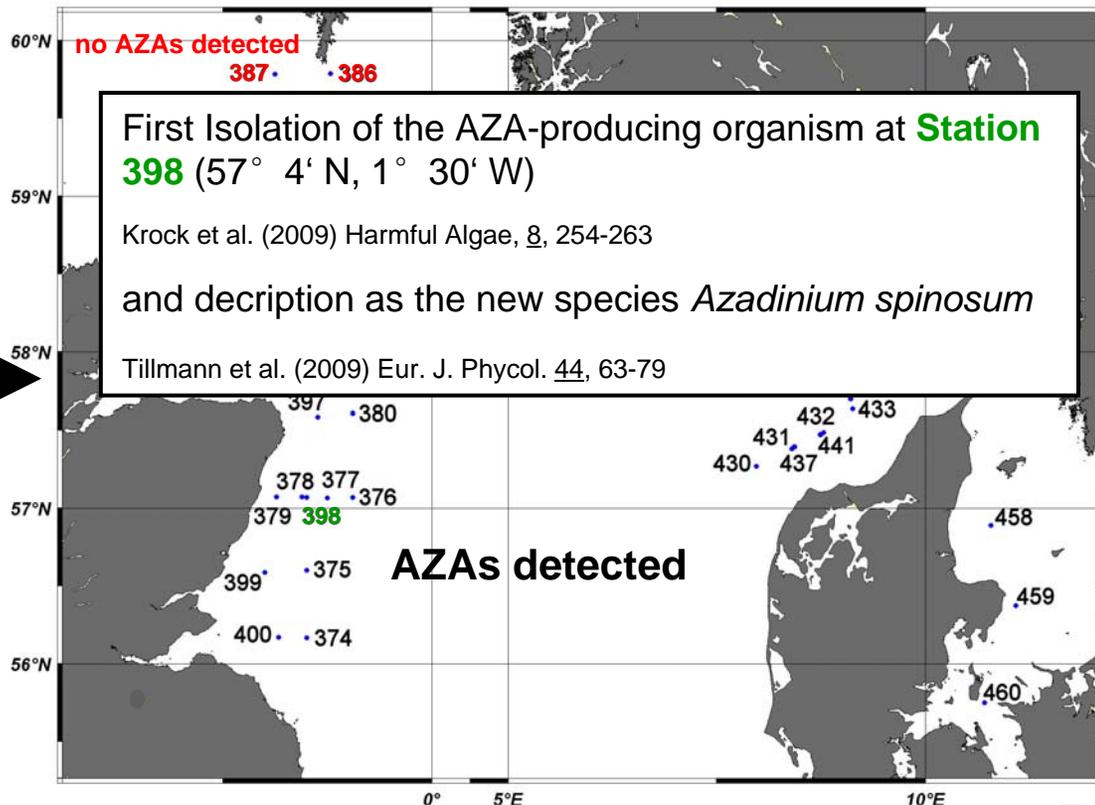

Historic Background

Moran et al. report that there was no correlation between the occurrence of *Protoperidinium* spp. in plankton and azaspiracids in shellfish in Irish waters over a four year period (2002 – 2006).

The authors exclude *Protoperidinium* as the source of azaspiracids

Azadinium spinosum

Indication for AZAs in the South Pacific

Conclusion

1. To date *A. spinosum* seems to be the only source for azaspiracids (AZAs)
2. *A. spinosum* produces only AZA-1, AZA-2 and an isomeric form AZA-X
All other azaspiracids seem to be shellfish metabolites derived from these three compounds
3. Two other species of the genus *Azadinium* do not produce AZAs
4. *A. spinosum* is ubiquitous in the North East Atlantic
5. There is indication of the presence of *A. spinosum* in the South Pacific (Chile)
