Data Report of RV "Polarstern" Cruises ARK IX/2 and 3

Bremerhaven - Tromsø
May 16 to June 24, 1993

Tromsø - Tromsø
June 26 to August 4, 1993

Summary

The expeditions ARK IX/2 and 3 of RV "Polarstern" to the Northeast Water Polynya (NEW) off Greenland was part of the main field phase of the International Arctic Polynya Programme (IAPP) under the umbrella of the Arctic Ocean Sciences Board (AOSB).

The major goal of the programme was a detailed study of the generation mechanisms of the polynya and its ecosystem and the effect of the polynya on the adjacent land ecosystem. Physical, biological, chemical and geological programmes were performed at sea to obtain a complete data set from this area.

This report includes physical, chemical and biological data. The locations of the stations are presented in Figs 1 and 2; for geographical positions refer to the data report on CTD Measurements by Budéus and Schneider. Details concerning the scientific programme and the cruise are described in the cruise report published in Reports on Polar Research, volume 142/94.

The data in this report are the property of the authors and may not be cited without prior reference of the authors.

Zusammenfassung

Die Expeditionen ARK IX/2 und 3 mit FS "Polarstern" in die Nordostwasser Polynja auf dem Ostgrönland-Schelf war Teil der Hauptfeldphase des International Arctic Polynya Programme (IAPP) unter der Schirmherrschaft des Arctic Ocean Sciences Board (AOSB).

Das Ziel des Programms war eine detaillierter Bestandsaufnahme der Entstehungsmechanismen der Polynja und ihres Ökosystems sowie ihrer Auswirkung auf das benachbarte grönländische Festland. Um einen möglichst vollständigen Datensatz zu erhalten, wurden auf FS "Polarstern" physikalische, chemische und biologische Untersuchungen durchgeführt.

Im folgenden Bericht sind physikalische, chemische und biologische Daten enthalten. Die Lage der Stationen ist in den Abb. 1 und 2 wiedergegeben; die geographischen Positionen sind dem Beitrag "CTD Measurements" von Budéus und Schneider zu entnehmen. Weitere Einzelheiten über das wissenschaftliche Programm und die Fahrt sind im Fahrbericht enthalten, der in den Berichten zur Polarforschung, Band 142/94, veröffentlicht ist.

Die in diesem Band enthaltenen Daten sind Eigentum der Autoren und dürfen nur nach Rücksprache zitiert werden.

1 CTD Measurements

G. Budéus and W. Schneider

Alfred Wegener Institute for Polar and Marine Research
Columbusstr., D-27515 Bremerhaven, Germany

This data report includes all recorded downcast CTD-profiles and all bottle sample protocols of Polarstern cruise ARK IX leg 2 and 3.

CTD casts have been performed with a Seabird 911+ system, equipped with a standard sensor set (pumped system to optimize time alignment and time constants of temperature and conductivity sensors) and a number of additional optical sensors. These are for measurements of chlorophyll fluorescence, backscattering, gelbstoff fluorescence (all three Dr. Haardt instruments), light intensity relative to the surface (LICOR with AWI interface) and transmission (Seatech instrument managed by SFB 313 Kiel). Gelbstoff measurements have not been recorded on stations 105 to 123. Four calibration checks have been performed in the central Greenland Sea (75°N , 3°W) at about 3000 m depth on May 23, June 22 and 27, and August 2, since the NEW area is not suited to calibrate CTD sensors by comparative temperature measurements and water sampling. Evaluation of the calibration casts yields an accuracy of better than 5 mK for temperature and 0.006 for salinity during the entire duration of the cruise. The data have been processed by standard methods using mainly Seabird software. This includes optimizing time alignment between conductivity and temperature measurements and optimizing their time response, correction for the thermal mass of the conductivity cell, suppression of possible upward CTD movements during downcasts and application of a median filter over 5 scans for the fluorescence sensors.

Naming convention

The naming convention for stations and casts is as follows: The profile is described by 8 characters; the first 4 characters indicate the cruise (ark9), the next 3 characters indicate the station; the last character stands for the cast number, starting with zero for the first cast of a station. Thus ark91230 is the first profile at station 123. Not in all cases do both downcast measurements and upcast bottle samples exist.

2 Hydrography beneath the ice

P.S. Galbraith, R.G. Ingram

Dept. of Atmospheric and Oceanic Sciences,
McGill University
805 Sherbrooke St. West,
Montreal, Quebec H3A 2K6, Canada

A selection of the CTD casts taken beneath drifting ice floes are shown. These were taken during three ice camps in ARKIX/2, and a fourth in ARK IX/3. Approximately one profile is shown for each 12-hour period of the ice camps. The hydrography beneath drifting ice floes and fast ice was measured during both legs 2 and 3 of cruise ARK IX using CTD profilers and moored equipment. In this report, a selection of the CTD profiles are shown, measured at intervals of approximately 12 hours. The intent is to provide a representative picture of the temperature and salinity coincident with other (biological) sampling beneath the ice. Two CTD instruments were used: a Seabird SBE 19, also known as the SeaCat, and a Guildline model 8709 profiler. Data from the Guildline were recorded on cassette tape and have not yet been decoded; they are therefore not included in this report.

ARK IX/2

The CTD casts presented here were measured during ice camps. After selection of a fairly smooth and large (more than one square kilometer) first year ice floe, the ship would stay alongside the ice and a camp would be set up at least 500 m away. Holes were drilled at the campsites to permit CTD sampling beneath the ice. Three such camps were done during ARK IX/2. The drift of the ice floes are shown in Figure 1, and the time, sampling depth and position of the CTD casts are summarized in Tables 1, 2, 3a and 3b.

ARK IX/3

First year ice had deteriorated by the beginning of leg 3 in late June. A last ice camp was therefore done on older, thicker ice in combination with the preparation of an instrumented drifting ice floe. The ice floe used for ice camp 4 was tracked for three weeks using an Argos buoy (Bauerfeind and Haupt). A variety of moored equipment were left beneath the ice, as well as a GPS recorder on the surface. Figure 2 shows the drift track from the GPS until July 16th when the memory of the unit was full; Argos data from Bauerfeind and Haupt are used thereafter. A few CTD casts were done during the preparation phase and one during the recovery of the instruments on July 29th. They are listed in Table 4.

Selected CTD profiles are shown at the end of this report. The most prominent feature is the layer of fresh water beneath the ice. The ice floe was selected on July 5th and a hole was drilled at 10:00 UTC in the middle of a large melt pond. When the hole was completed, water drained into the hole in a strong vortex which lasted for more than 24 hours, melting the hole diameter to many times its original size. Thus it is unclear how much of the fresh water found below the ice floe can be attributed to our drilling and draining of the melt pond.

Tables 5 and 6 list CTD casts taken from fast ice on the North and South of the NEW polynya. Table 7 lists the calibration CTD cast taken from RV "Polarstern". The SeaCat profiler was attached to the rosette and recorded simultaneously with the CTD usually used from the ship (Budéus and Schneider), sts 279-3.

CTD casts

The following pages show selected CTD profiles from the four ice camps in addition to the calibration profile. The SeaCat conductivity data have been low-passed filtered with a time constant of 0.5 s, and the temperature data have been advanced relative to pressure by 0.5 s. In spite of these adjustments, some static instabilities remain in the data, most notably in the top 10 m of some ice camp 1, 2 and 3 profiles. Also, salinity oscillations appear in other profiles spanning high gradients (e.g. halocline of ice camp 4 profiles). These data were nevertheless included in the figure, but should be considered with caution by the reader as preliminary data. Further investigation and comparison with Guildline data will hopefully resolve ambiguities about their correctness.

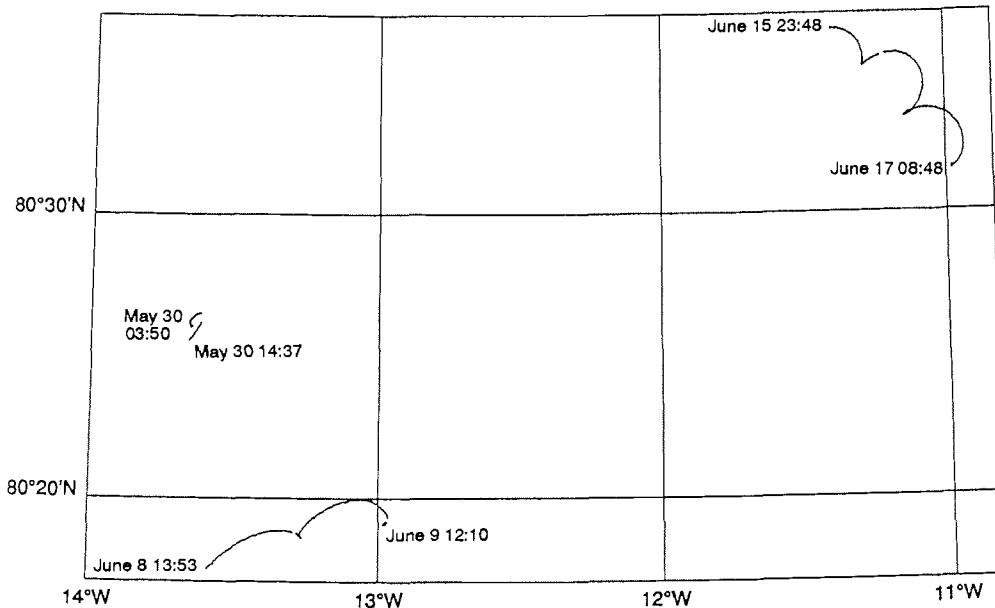

Figure 1: Drift tracks of the three ice camps of ARK/IX-2. Ice camp 1 (May 30th 1993) drifted in a clockwise fashion. The data gap in the middle is due to GPS battery failure.

3 Distribution of nutrients

G. Kattner, B. Hollmann, A. Michel, K.-U. Richter, M. Stürcken-Rodewald

Alfred Wegener Institute for Polar and Marine Research
Am Handelshafen 12
D-27570 Bremerhaven, Germany

Water samples were taken with CTD casts by a 12 bottle rosette sampler connected to the CTD probe. All samples were analysed for nitrate, nitrite, phosphate, ammonium and silicate with a Technicon Autonalyzer II system according to standard methods. Since on many stations additional casts were necessary for water sampling the data set contains the cast number and the bottle number for each sample. Therefore it is possible to select the data of each special sample. This may result in small inconsistencies due to the high variability of the nutrient distribution. If you find any other inconsistencies in the data or if you have any other difficulties please contact the authors.

This data set contains the so-called "Soll-depths". For the exact depths please refer to the hydrographic data set. For date, time and location of the stations, please refer to the station list in the cruise report.

Rimouski, Québec G5L 3A1, Canada

***University of Waterloo,
Department of Biology,
Waterloo, Ontario, Canada N2L 3G1

Legend to table

Station: Station number. Missing stations were either not sampled or showed errors due to the equipment or to manipulations.

Depth: Depth of sampling from the surface in meters.

Chla GF/F: Measured concentrations of Chlorophyll *a* pigments retained on a Whatman GF/F filter. In micrograms per liter.

Phaeopig. GF/F: Measured concentrations of Phaeopigments retained on a Whatman GF/F filter. In micrograms per liter.

Chla Poretic 5 μ : Measured concentrations of Chlorophyll *a* pigments retained on a Poretic 5 microns pore size filter. In micrograms per liter.

Phaeopig. Poretic 5 μ : Measured concentrations of Phaeopigments retained on a Poretic 5 microns pore size filter. In micrograms per liter.

Chla Nitex 20 μ : Measured concentrations of Chlorophyll *a* pigments retained on a Nitex 20 microns pore size filter. In micrograms per liter.

Phaeopig. Nitex 20 μ : Measured concentrations of Phaeopigments retained on a Nitex 20 microns pore size filter. In micrograms per liter.

Notes:

1. Calibration equations for the Turner fluorometer used on RV "Polarstern" is available. Please communicate with Stéphane Pesant.
2. Negative concentrations of phaeopigments are reported in this table. Their correction is left to your discretion.
3. Blanks in this table represent absence of data and "0.000" represent measured values inferior to 0.000.

Department of Biology,
Waterloo, Ontario, Canada N2L 3G1

Legend to table

Station: Station number. Missing stations were either not sampled or showed errors due to the equipment or to manipulations.

Depth: Depth of sampling from the surface in meters.

%light: Percentage of surface (0 m) PAR reaching the depth of sampling. PAR (Photosynthetically active radiations; 400-700nm) was measured on the rosette with a LICOR underwater quantum PAR meter.

Irradiance received: Total PAR that reached the deck incubator during the incubation of the 2 light and 1 dark bottles. PAR was measured on the deck every 30 min. with a LICOR quantum PAR meter. Calculations according to Legendre et al. (1993, M.E.P.S.98:297-313).

Average total primary production

Std total prim.prod.: Primary production of the total fraction of phytoplankton filtered on GF/F, measured from the two light bottles. Average and standard deviation of the two measurements are given.

Average >5µm primary production

std.>5µm Prim.prod.: Primary production of the large fraction of phytoplankton (filtered on Poretics 5µm pore size filters) measured from the two light bottles. Average and standard deviation of the two measurements are given.

Total dark uptake

>5µm dark uptake: Carbon uptake of the total (GF/F) and large (Poretics 5µm) fractions of the phytoplankton, measured from the dark bottle.

Prim prod cells>5µm (%): Percent of the total primary production accounted for by the large fraction (cells > 5µm) of the phytoplankton.

6 Zooplankton dry weight

H.-J. Hirche, J. Wegner, B. Niehoff

Alfred Wegener Institute for Polar and Marine Research
Columbusstr., D-27515 Bremerhaven, Germany

Dry weight was determined from bongo net tows (200 µm mesh). The sample was split, drained over 200 µm and filtered on pre-weighed GF/A filters (55 mm diameter). Large medusae and ctenophores were removed. The sample was deep frozen until analysis. After drying at 60°C over 48 h the filter was weighed. No correction was made for phytoplankton collected on the filter.

7 Zooplankton grazing

J.L. Acuña and D. Deibel

Ocean Sciences Centre
Memorial University of Newfoundland
St. John's A1C 5S7, Newfoundland, Canada.

Introduction

This is an interim data report of the samples we have been able to analyze and work up as of 1 December 1993. It contains data obtained during cruises ARK IX/2 and ARK IX/3, and the results of fluorometric analyses of frozen samples of appendicularians and seston. The aim of this research is to simultaneously determine the feeding impact of copepods and appendicularian tunicates on a broad space and time scale in the North-East Water Polynya. To do this, we made use of the gut phytopigment method (e.g. Madin, 1992, in salps; Head, 1986, in copepods), which involves the estimation of gut phytopigment content and gut passage time. The method has been widely used in copepods, but never in appendicularians.

Methods

Tunicates and copepods were collected using vertical hauls of a 200 µm mesh net with a 0.5 m diameter mouth from 200 m depth to the surface. Cod-end contents were immediately taken to a 0°C cold container laboratory and diluted with filtered seawater from near surface. Following the removal of a subsample for taxonomy, ca. 50 copepods were sieved from the bucket with a 500 mm mesh cup and rinsed repeatedly in filtered seawater to remove phytoplankton. Next, the content of the sieve cup was concentrated and pipetted onto a 45 mm diameter disk of sharkskin filter paper, folded into an aluminum foil sleeve and flash frozen in liquid nitrogen. Samples were stored at -20°C until analysis.

Following removal of the copepod subsample, appendicularians were picked by hand from the remaining cod-end contents. Each was rinsed repeatedly in filtered seawater, and pipetted into a petri dish. After 5-20 animals had been rinsed, each was identified and measured under red light in a dissecting microscope to the nearest 0.02 mm, and the number of fecal pellets present recorded. Single fecal pellets were then transferred to 1.5 ml Eppendorf tubes which were flash frozen in liquid nitrogen and stored as above for copepods. In part of the stations, animals that were active but unable to build filter houses were placed onto petri dishes and allowed to evacuate their guts for 1-2h. Fecal pellets were then collected for gut pigment as above. The following summary contains the standard protocol used in our laboratory for gut pigment analysis of appendicularians. Eppendorf tubes containing individual appendicularians were sonicated for 10 min and extracted in 90% acetone for 24 h. A second sonication was made during extraction to ensure high recovery of pigments. Pigment analysis is done by the standard fluorometric technique using a Sequoia-Turner model 450 instrument calibrated against a pure chlorophyll standard. Total phaeopigments were determined after acidification of the extract. The extracted samples were maintained at 0°C, but were read at room temperature. Periodically, samples are set aside for detailed pigment composition analysis using HPLC.

Copepods for gut passage time experiments were collected from the 200 mm mesh plankton net as above for gut pigment analysis. Following isolation with a 500 mm mesh sieve cup, the animals were backwashed into 500 ml of water collected with a Niskin bottle from the subsurface chlorophyll maximum (SCM). Simultaneously, 400 ml of water from the SCM were stained with 2 drops of concentrated neutral red stain. After a preincubation interval of from 1-12 h, 20 ml of the stained sample was poured into each of 20 petri dishes. Next, a single animal was pipetted into each dish and the initial time recorded. For the next 4 h each dish was examined microscopically for fecal pellets every 20 min, followed by examination each 60 min up to 6 h after time initial. All fecal pellets were recorded, and the time of appearance of the first fecal pellet containing stained phytoplankton recorded. The gut passage time was defined as the interval between the initial time and the time of appearance of the first stained phytoplankton in a pellet. The animals were then left for 12 h and examined to determine the total number that released stained fecal pellets. Following the experiment, each animal was identified and staged, and the cephalothorax length measured to the nearest 0.04 mm.

Appendicularians for gut passage time experiments were collected with a large cod-end plankton net made of 110 mm mesh. The net is 1 m in diameter, and the closed, acrylic cod-end measures 30 x 60 cm (40 liters). The net was towed very slowly from 100 m to the surface. Immediately after the tow, the cod-end was carried to the 0°C laboratory container, and appendicularians in their houses removed with a custom designed, large diameter slurp syringe that we have recently developed (Acuna et al., submitted). Single animals were transferred to beakers of water collected from beneath the SCM, which was prefiltered through 20 um mesh. Next, the beakers were hung from the ceiling of the container from elastic bands. This independent suspension system was necessary because we found the appendicularians to be impossible to maintain in beakers on the laboratory bench, apparently because of their sensitivity to ship vibrations, particularly during ice-breaking operations. We found appendicularians in these hanging beakers to behave normally, and to build a number of houses over 12-24 h time. We did not attempt to determine how long we could maintain appendicularians alive using this system.

After it was determined that an appendicularian was pumping normally within its house, a dilute suspension of cornstarch was added to the beaker and mixed gently. Over the next several hours each animal was observed continuously, and the time of appearance of each fecal pellet recorded. The gut passage time was defined as the difference between the initial time and the time of appearance of the first fecal pellet containing the white cornstarch marker. Fecal pellet production rate was calculated by dividing the total number of pellets produced by the incubation interval. The estimated number of faecal pellets was calculated by dividing the gut passage time of each animal by the average time between successive faecal pellets.

Results

Chlorophyll-a concentrations during ARK IX/2 ranged between 0.01 and 4.34 mg l⁻¹, and total phaeopigment concentrations between 0.11 and 4.92 mg l⁻¹ (Table 1). The percentage of phaeopigments varied between 52 and 88, averaging of 69±13% (mean±SD, n=10). In general, it tended to decrease with increasing concentration of total pigments.

Total gut pigment in *O.vanhoeffeni* plus *O.labradoriensis* ranged between detection limit nd 119 ng individual⁻¹; faecal pellet pigment content varied between detection limit and 81 ng faecal pellet⁻¹. On average, phaeopigments made up 94±10% (mean±SD) of the total gut pigment content. There was a general trend towards increasing total gut pigment with increasing body size. When pooling all samples, this trend was still apparent (Figure 7). The shape of this relationship suggests a power function of gut pigment content vs body size in *O.labradoriensis*. Undoubtedly, areal differences in chlorophyll concentration may account for much of the scatter in fig. 7a.

O.labradoriensis and *O.vanhoeffeni* showed similar average gut passage times of about 75 minutes, similar average time interval between faecal pellets of about 40 minutes, and similar faecal pellet production rates of about 40 faecal pellets per day (Table 2). None of these rates showed significant differences between species (Kruskall-Wallis ranks test; P>0.25).

Table 3 contains an initial descriptive statistical analysis of the gut passage time (GPT) experiments done with copepods. GPT ranged from ca. 60 min. for adult females of *C.finmarchicus* to ca. 190 min. for adult females of *C.glaucus*. The GPT results are most distinguished by their variability, with coefficients of variation within stages ranging from 29-85%. Typically, the GPT data were not normally distributed, therefore the median GPT is reported in Table 4. In general, GPT decreased with increasing stage and body size within each species, with significant regressions between GPT and body size in *C.finmarchicus* (n=23, F=3.37, p=0.08) and *C.hyperboreus* (n=86, F=6.21, p=0.01), and between GPT and stage in *C.hyperboreus* (n=86, F=5.60, p=0.02). The above regression slopes were always negative. However, due to the high variability of the GPT data, the proportion of variance accounted for by the above regressions was never > 10%. It should be remembered that many factors can affect GPT, including temperature, body size, food concentration, time of day, etc. How much of the total variance remaining that may be explained by these other factors awaits further data analysis.

8 Distribution and body size of fish larvae

L. Fortier, P. Rowe, J. Michaud

Université Laval
Département de Biologie,
Ste-Foy, Québec, Canada G1K 7P4

Legend to table

GEAR: BONGO NETS(B): 200& 500 mm, 60 cm diameter, vertical tows
 include 64 mm, 10 cm diameter, sock net
 RMT (R): rectangular midwater trawl with 1 m² (300 mm) & 8m²
 (2000mm), includes 64 mm sock net
 RF NET (RF): vertically towed, 1 m diameter, nytex (sailcloth)
 appendicularian collector
 PUMP (P): large volume pump, 2.8 m³. min⁻¹, deployed at ice
 camp stations
 STANDARD NETS (S): vertical tows taken at ice camp stations
 with 1m diameter (500mm) & 0.5 diameter (64 & 150 mm)

CATCH: number of larvae caught at station

LENGTH: mean notochord length of spp. at station

STD: standard deviation

N: number of larvae measured for length

Station 9

Station 10

Station 25

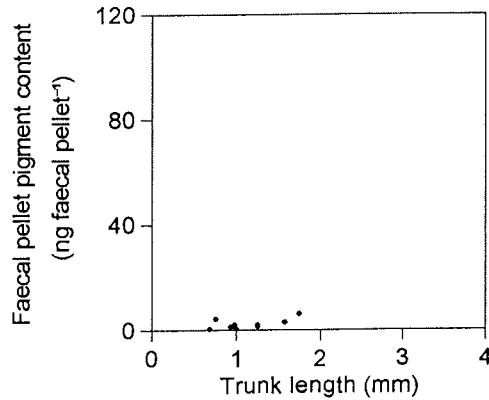

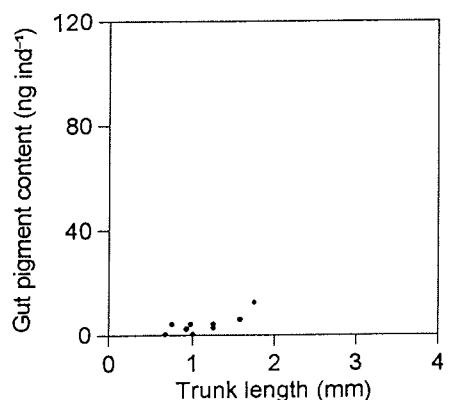

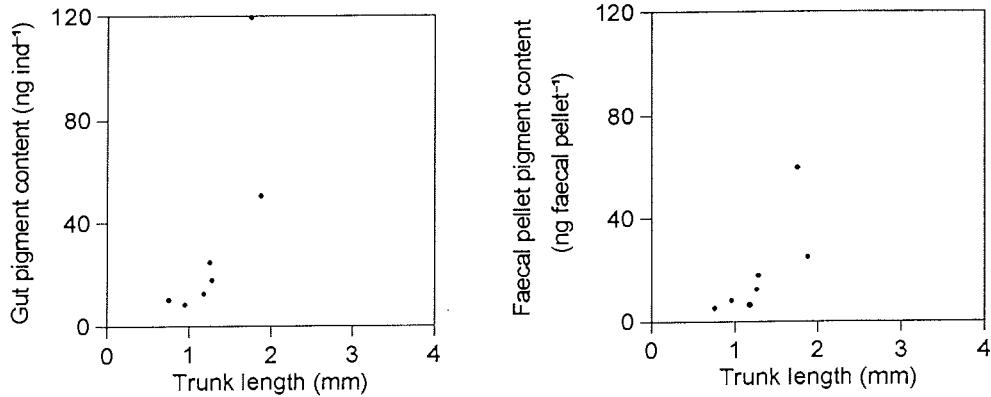

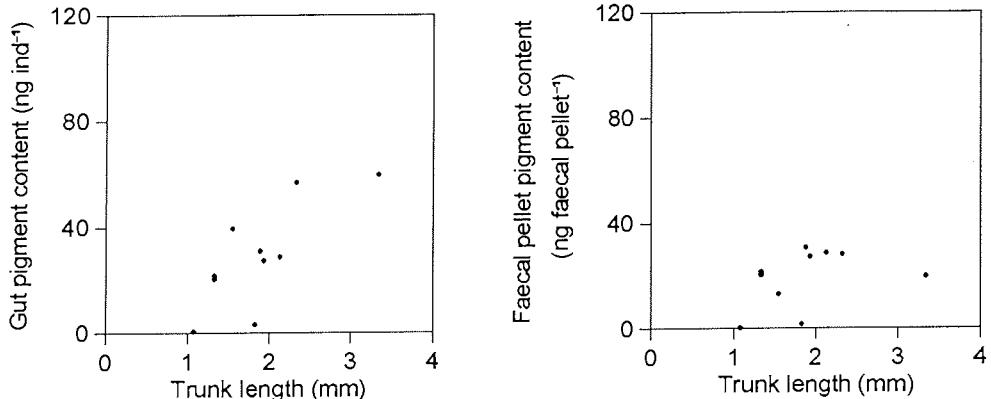

Figure 1: Plot of gut pigment content (chlorophyll a plus phaeopigments) versus trunk length, left, and faecal pellet pigment content versus trunk length, right, at stations 9, 10, and 25. Values not corrected for background fluorescence.

Station 45

Station 89

Station 98

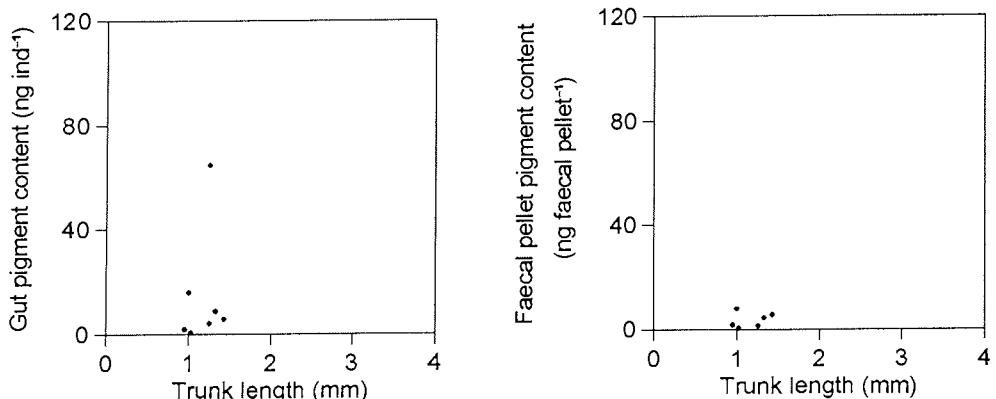

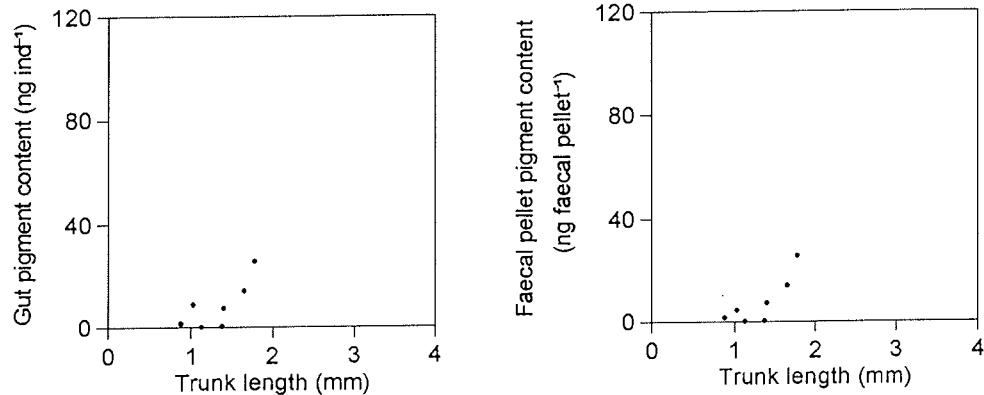

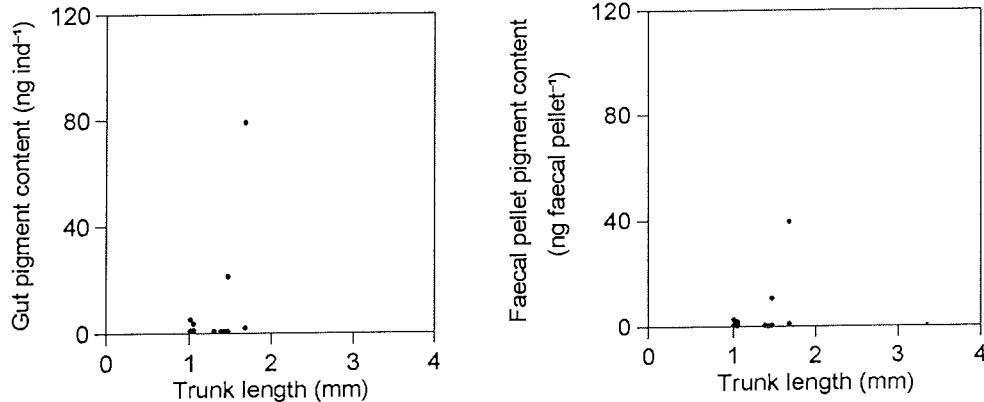

Figure 2: Plot of gut pigment content (chlorophyll a plus phaeopigments) versus trunk length, left, and faecal pellet pigment content versus trunk length, right, at stations 45, 89, and 98. Values not corrected for background fluorescence.

Station 100

Station 117

Station 118

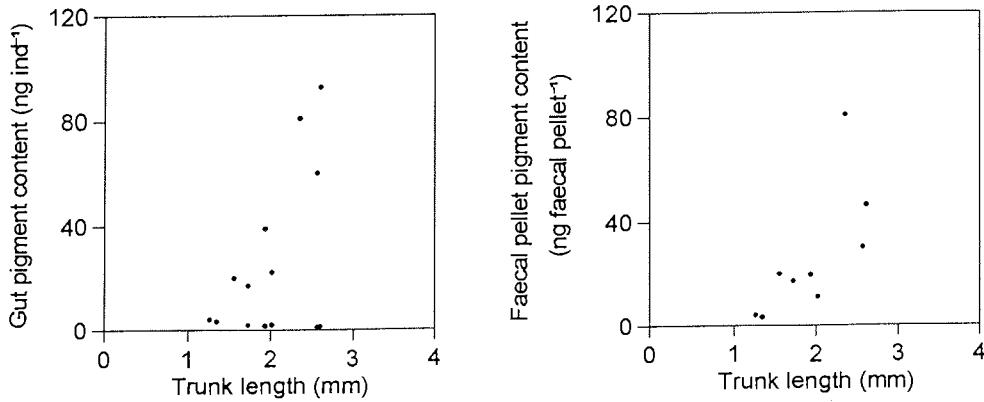

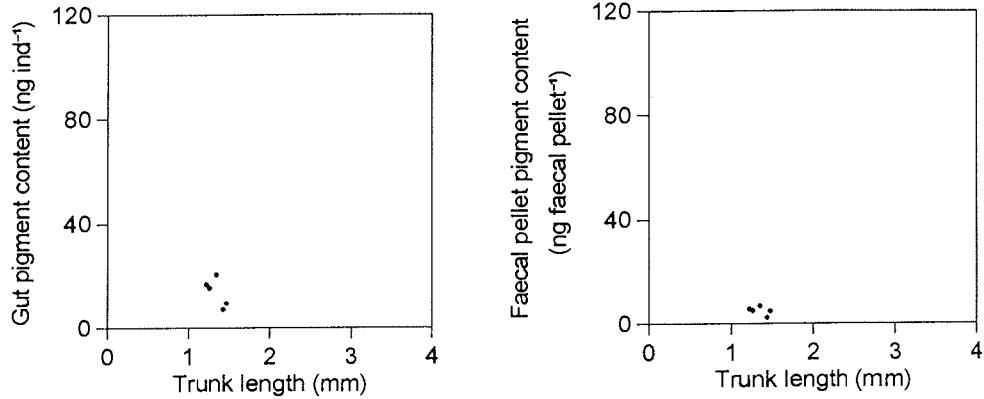

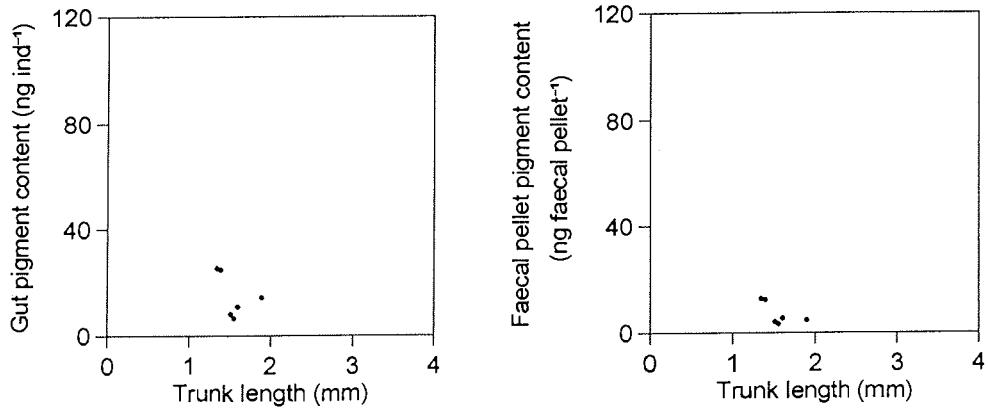

Figure 3: Plot of gut pigment content (chlorophyll a plus phaeopigments) versus trunk length, left, and faecal pellet pigment content versus trunk length, right, at stations 100, 117, and 118. Values not corrected for background fluorescence.

Station 120

Station 123

Station 125

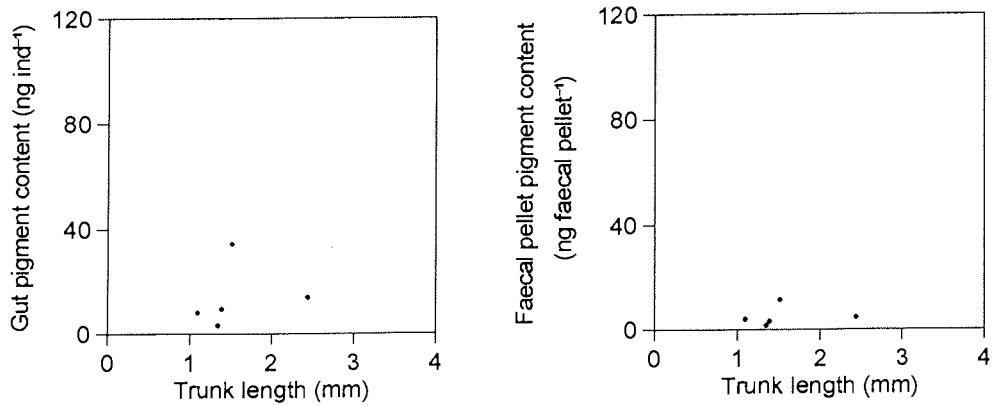

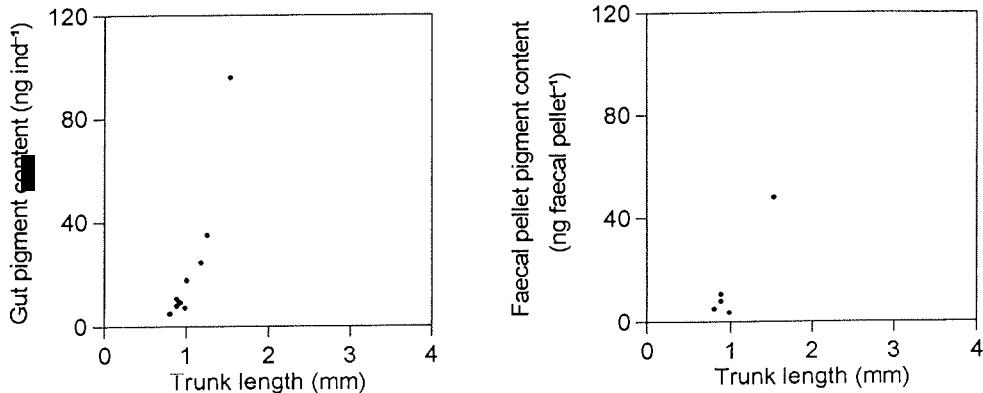

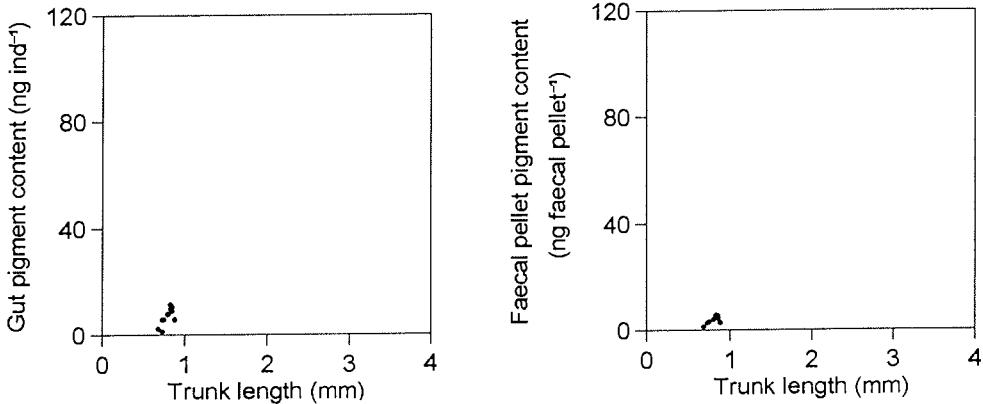

Figure 4: Plot of gut pigment content (chlorophyll a plus phaeopigments) versus trunk length, left, and faecal pellet pigment content versus trunk length, right, at stations 120, 123, and 125. Values not corrected for background fluorescence.

Station 146

Station 148

Station 154

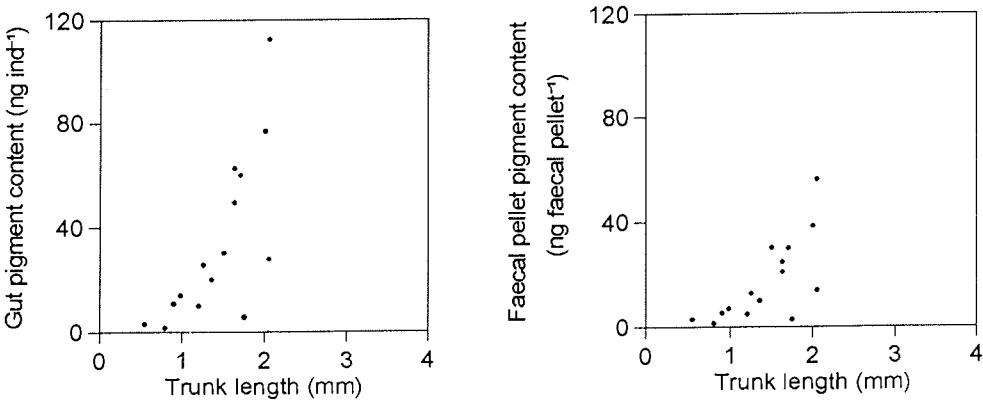

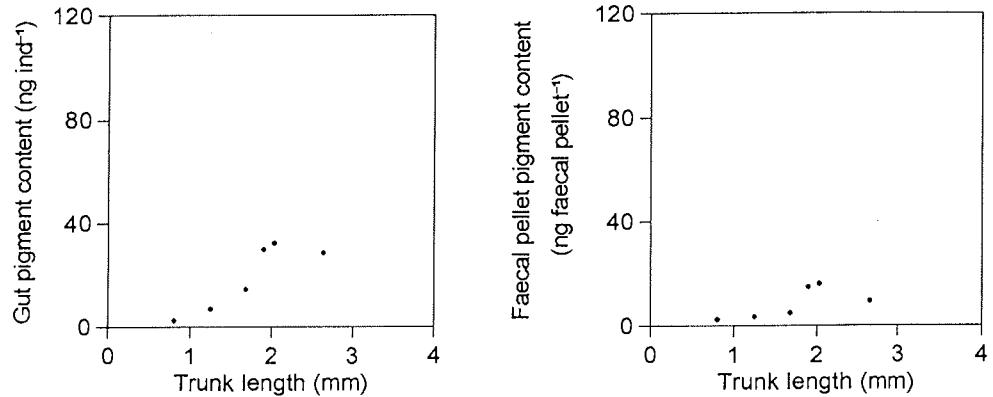

Figure 5: Plot of gut pigment content (chlorophyll a plus phaeopigments) versus trunk length, left, and faecal pellet pigment content versus trunk length, right, at stations 146, 148, and 154. Values not corrected for background fluorescence.

Station 163

Station 226

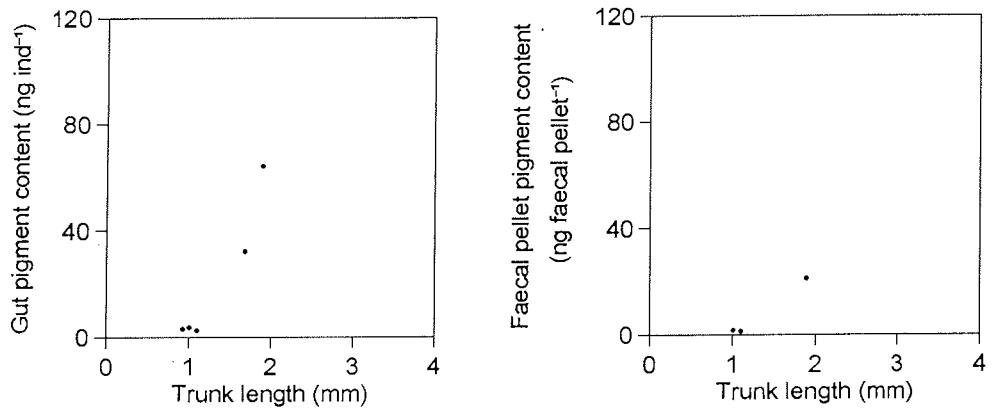

Figure 6: Plot of gut pigment content (chlorophyll a plus phaeopigments) versus trunk length, left, and faecal pellet pigment content versus trunk length, right, at stations 163 and 226. Values not corrected for background fluorescence.

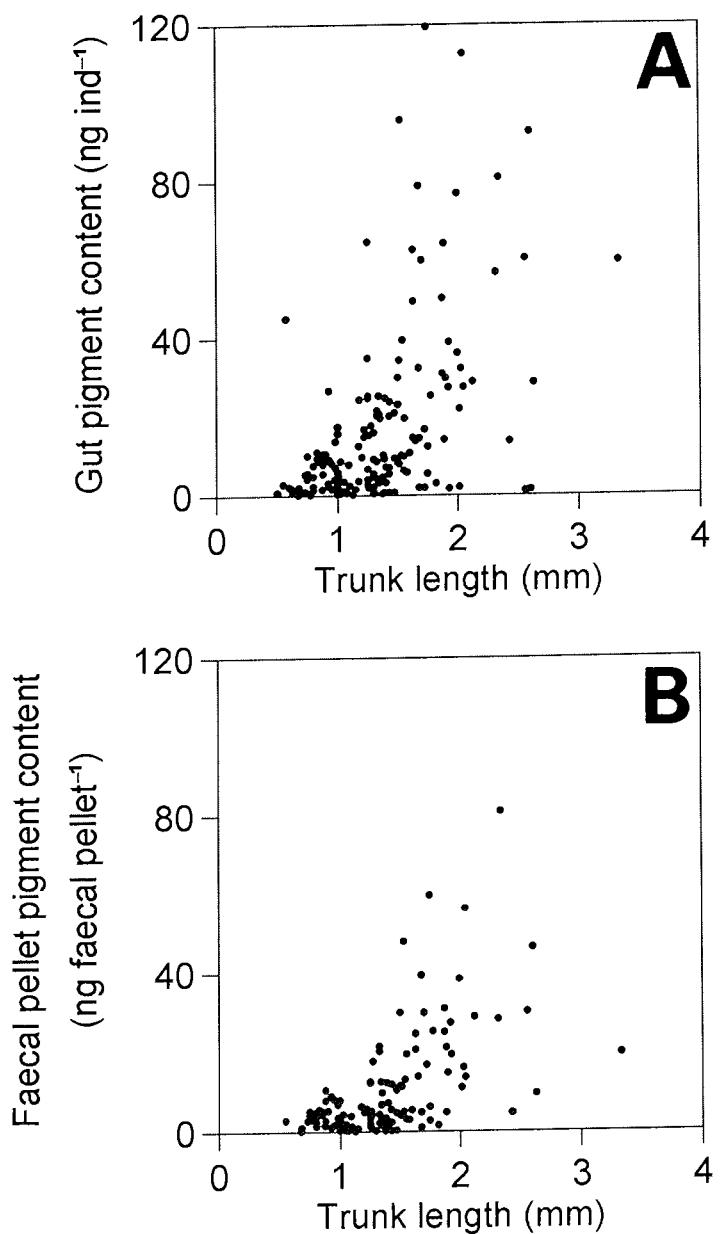

Figure 7: A) Plot of gut pigment content (chlorophyll a plus phaeopigments) versus trunk length for the total of samples analyzed ($n=168$); B) Plot of faecal pellet pigment content (chlorophyll a plus phaeopigments) versus trunk length for the total of samples analyzed ($n=131$). Appendicularian gut pigment content has been analyzed at stations 5, 8, 9, 10, 24, 27, 39, 45, 56, 89, 98, 100, 117, 118, 119, 120, 123, 125, 146, 148, 152, 153, 154, 163 and 226.
