

Parameter

Water temperature (°C)

Abbreviation: Temp

Parameter no: 717

Dive, temperature measurements based on the animal mounted collection system SRDL Series 9000 show water temperature at different diving depths.

Data collected using Series 9000 SRDLs follow this configuration. These data do not have an Argos quality flag, as they have been subjected to a filter algorithm defined by Sea Mammal Research Unit.

It is imperative to read the "Further details" section of each event label prior to data retrieval and analyses. The section summarizes the hardware configuration and the user-defined settings upon deployment. For technical specifications on hard- or software configurations of the different satellite transmitters you have to consult the respective manufacturers.
