# Th isotopes (<sup>234</sup>Th, <sup>230</sup>Th and <sup>232</sup>Th) and <sup>231</sup>Pa during the expedition Zero and Drake (PS71/), Southern Ocean

Celia Venchiarutti, AWI, E-mail: Celia.Venchiarutti@awi.de

## Sampling and Methods

Published in:

Venchiarutti C., Rutgers van der Loeff M. and Stimac I. (Deep-Sea Research II, in press). Scavenging of <sup>231</sup>Pa and thorium isotopes based on dissolved and size-fractionated particulate distributions at Drake Passage (ANT-XXIV/3)

## Summary

On board Polarstern

Dissolved Samples:collected with AWI-CTD, using 20L of seawater. Filtered at 0.45µm (Supor filters, 142 mm diameter), acidified, weighed and stored

Particle Samples: collected with in-situ pumps, using 3 different filters (Nitex 50µm and 10µm, Supor 0.8µm of 142 mm diameter). 400-800 L filtered seawater. Ultrasonication of the Nitex filters and second filtration to collect the fractions 50µm and 10µm on Supor filters 47 mm diameter.

#### In the AWI clean-lab

Dissolved samples: coprecipitated with iron, cleaning and separation by centrifugation, column chemistry, analysis with HR-ICP-MS (Element 2, AWI)

Particle Samples: successive leaching in strong acid media, column chemistry, analysis with HR-ICP-MS (Element 2, AWI)

Please refer to cited publication for details on mass spectrometric measurements and correction applied to the isotopic ratios and concentrations

## Dissolved <sup>230</sup>Th. <sup>232</sup>Th and <sup>231</sup>Pa

All the concentrations are reported in excess (noted with subscript xs), i.e. corrected for the detrital contribution (fraction)

 $^{230}\text{Th}_{xs} = ^{230}\text{Th}_{\text{measured}} + ^{232}\text{Th}_{\text{measured}} + ^{238}\text{U}/^{232}\text{Th}_{\text{litho}}$ 

with  $(^{238}\text{U}/^{232}\text{Th})_{\text{litho}} = 0.4 \pm 0.1$  South of the Antarctic Polar Front

(Anderson et al. 1990; Rutgers van der Loeff and Berger, 1993; Walter et al., 1997)

al., 1997)  $^{231}\text{Pa}_{xs} = ^{231}\text{Pa}_{\text{measured}} - (^{235}\text{U}/^{238}\text{U})_{\text{natural}} * (^{238}\text{U}/^{232}\text{Th})_{\text{litho}} + (^{232}\text{Th})_{\text{measured}} + (^{235}\text{U}/^{238}\text{U})_{\text{natural}} + (^{235}\text{U}/^{238}\text{U})_{\text{natural}} + (^{235}\text{U}/^{238}\text{U})_{\text{natural}} + (^{235}\text{U}/^{238}\text{U})_{\text{natural}} + (^{235}\text{U}/^{238}\text{U})_{\text{natural}} + (^{235}\text{U}/^{238}\text{U}/^{238}\text{U})_{\text{natural}} + (^{235}\text{U}/^{238}\text{U})_{\text{natural}} + (^{235}\text{U}/^{238}\text{U})_{\text{natural}} + (^{235}\text{U}/^{238}\text{U}/^{238}\text{U})_{\text{natural}} + (^{235}\text{U}/^{238}\text{U}/^{238}\text{U}/^{238}\text{U})_{\text{natural}} + (^{235}\text{U}/^{238}\text{U}/^{238}\text{U}/^{238}\text{U})_{\text{natural}} + (^{235}\text{U}/^{238}\text{U}/^{238}\text{U}/^{238}\text{U}/^{238}\text{U})_{\text{natural}} + (^{235}\text{U}/^{238}\text{U}/^{238}\text{U}/^{238}\text{U}/^{238}\text{U})_{\text{natural}} + (^{235}\text{U}/^{238}\text{U}/^{238}\text{U}/^{238}\text{U}/^{238}\text{U}/^{238}\text{U})_{\text{natural}} + (^{235}\text{U}/^{238}\text{U}/^{238}\text{U}/^{238}\text{U}/^{238}\text{U}/^{238}\text{U})_{\text{natural}} + (^{235}\text{U}/^{238}\text{U}/^{238}\text{U}/^{238}\text{U}/^{238}\text{U}/^{238}\text{U}/^{238}\text{U})_{\text{natural}} + (^{235}\text{U}/^{238}\text{U}/^{238}\text{U}/^{238}\text{U}/^{238}\text{U}/^{238}\text{U}/^{238}\text{U})_{\text{natural}} + (^{235}\text{U}/^{238$ 

(Scholten et al., 1995, 2005; Moran et al., 2005)

Note: All the dissolved concentrations are corrected for Th-ingrowth adn Pa-ingrowth from  $^{234}$ U and  $^{235}$ U decay respectively (based on storage time)

## Total Particulate <sup>230</sup>Th, <sup>232</sup>Th and <sup>231</sup>Pa

It is the sum of the concentrations (activities in dpm/ $m^3$ ) in the three size-fractionated particle samples >50 $\mu$ m, 10-50 $\mu$ m and 0.8-10 $\mu$ m

It corresponds to all the particles > 0.8µm

Lithogenic concentrations (in excess) are calculated like dissolved concentrations (see explanation above)

### Total Particulate <sup>234</sup>Th

Directly measured on board

for stations: PS71/131-6, PS71/161, PS71/178-3 only fractions 50 µm and 10 µm and

for stations: PS71/193, PS71/222-2, PS71/230 and PS71/241-7: all the three fractions Measured using a RISØ-beta counter (cf. Rutgers van der Loeff et al., 2010 doi.10.1594/PANGAEA.745451).

The total particulate concentration is here also the sum of the concentrations of the three particulate size-fractions

#### Conversions

	fg/kg in dpm/m <sup>3</sup>
<sup>231</sup> Pa (T <sub>1/2</sub> =32760 yrs)	0.1078
<sup>230</sup> Th (T <sub>1/2</sub> )=75380 yrs	0.0470
<sup>232</sup> Th (T <sub>1/2</sub> )=14.0*10 <sup>-10</sup>	pg/kg in dpm/m <sup>3</sup>
yrs	0.00025

taking into account density of seawater  $\rho$ =1.027 kg/m<sup>3</sup> error: standard deviation [+/-] = 1-sigma propagated error
