Helicopter and fixed-wing aircrafts

Airborne EM and Satellite Mission

CryoSat Cal/Val Concept

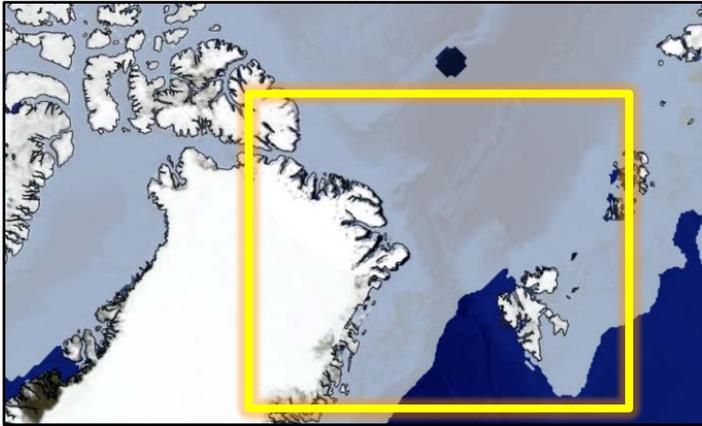

Sources of Uncertainty

- Sea surface height anomaly
- Radar penetration into snow
- Sub-footprint scale surface roughness
- Variability of snow and ice density
- Snow depth
(or snow-water-equivalent)

Laser – Radar Altimetry

- Radar penetration into snow
- High resolution validation data
- Thickness retrieval validation

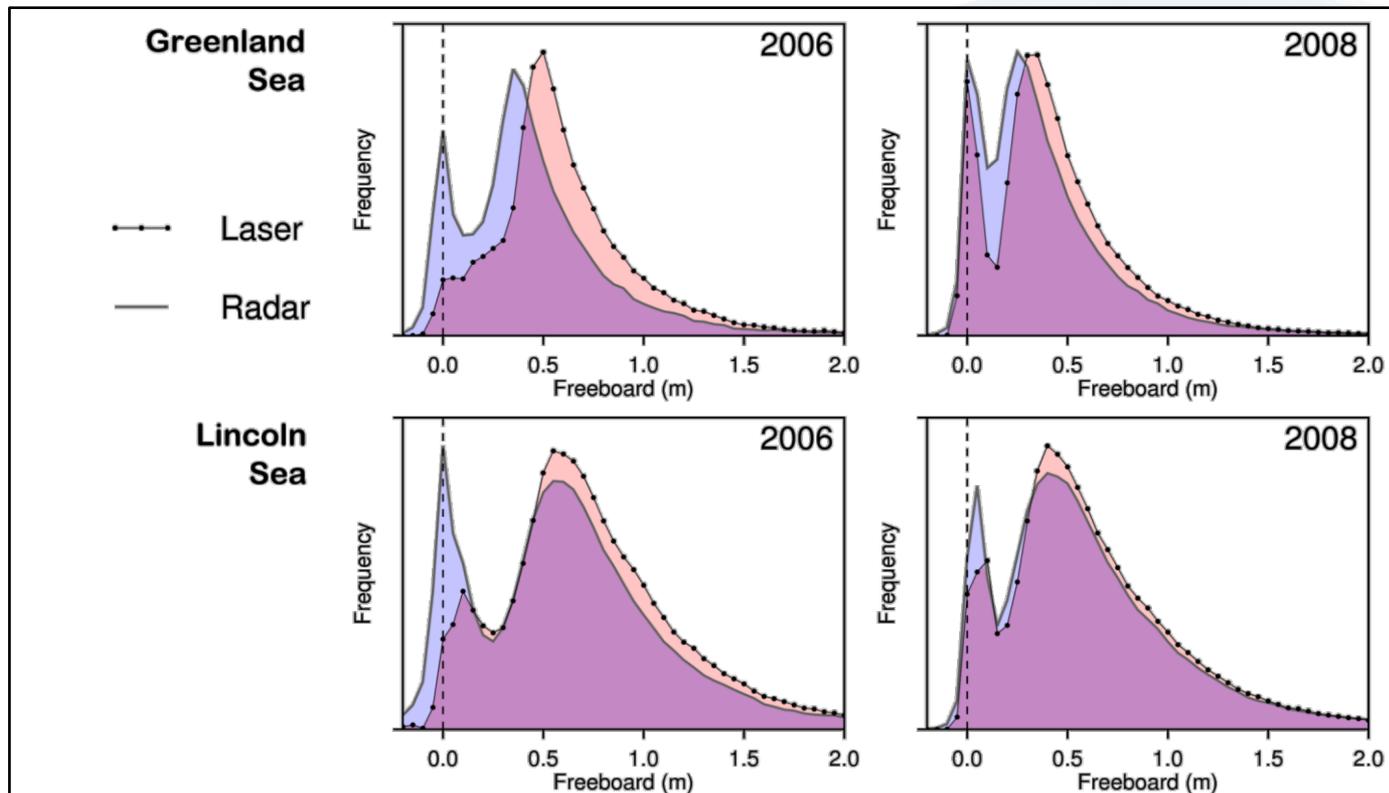

Radar Penetration into Snow

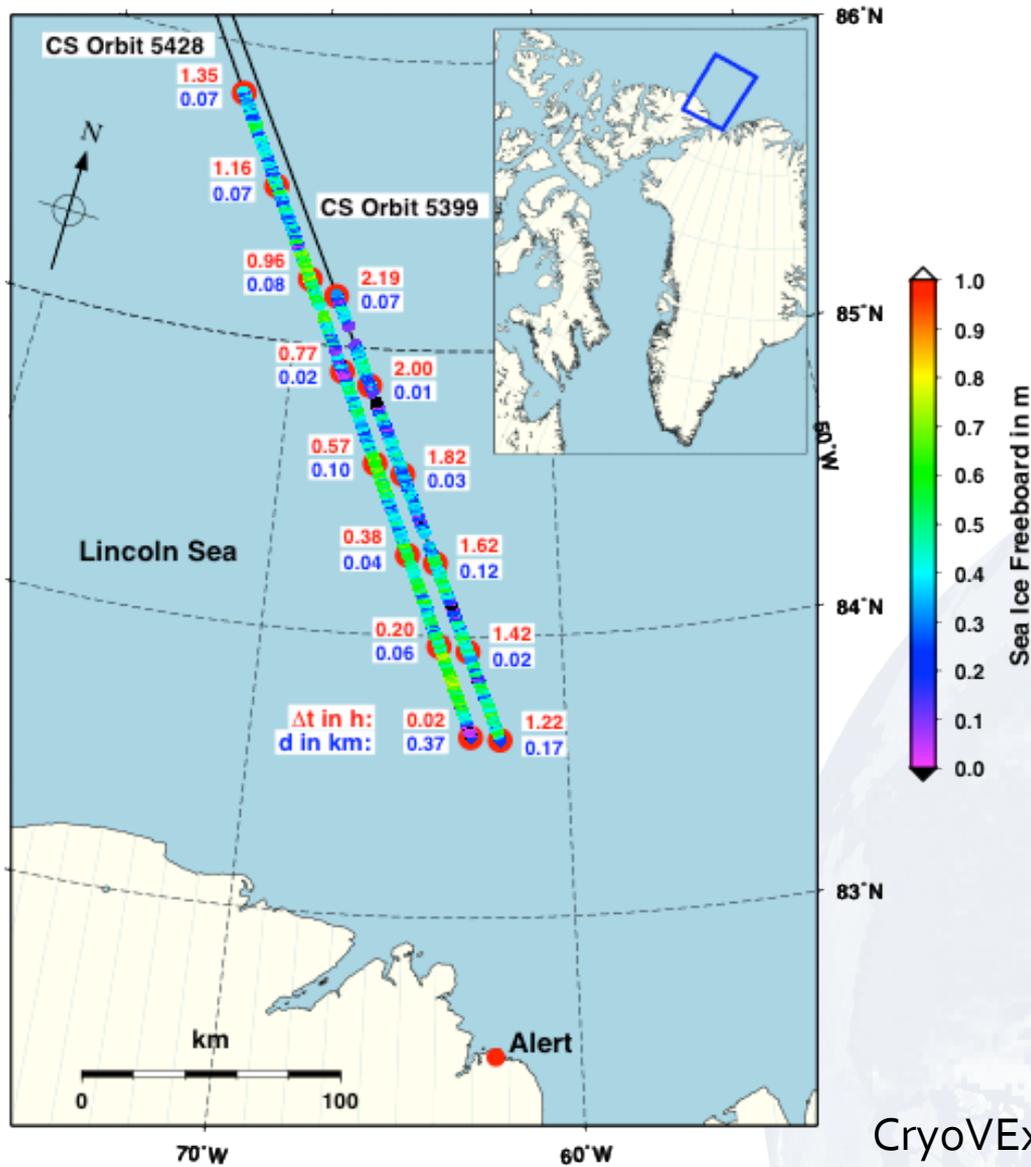

CryoVEx 2006/2008

Modal difference not large enough for typical snow depth

Might not have been „cold“ snow anymore

Direct comparison to CryoSat-2

Twin Otter (DTU-Space)

ASIRAS (Airborne CryoSat-2 simulator)
Airborne Laserscanner

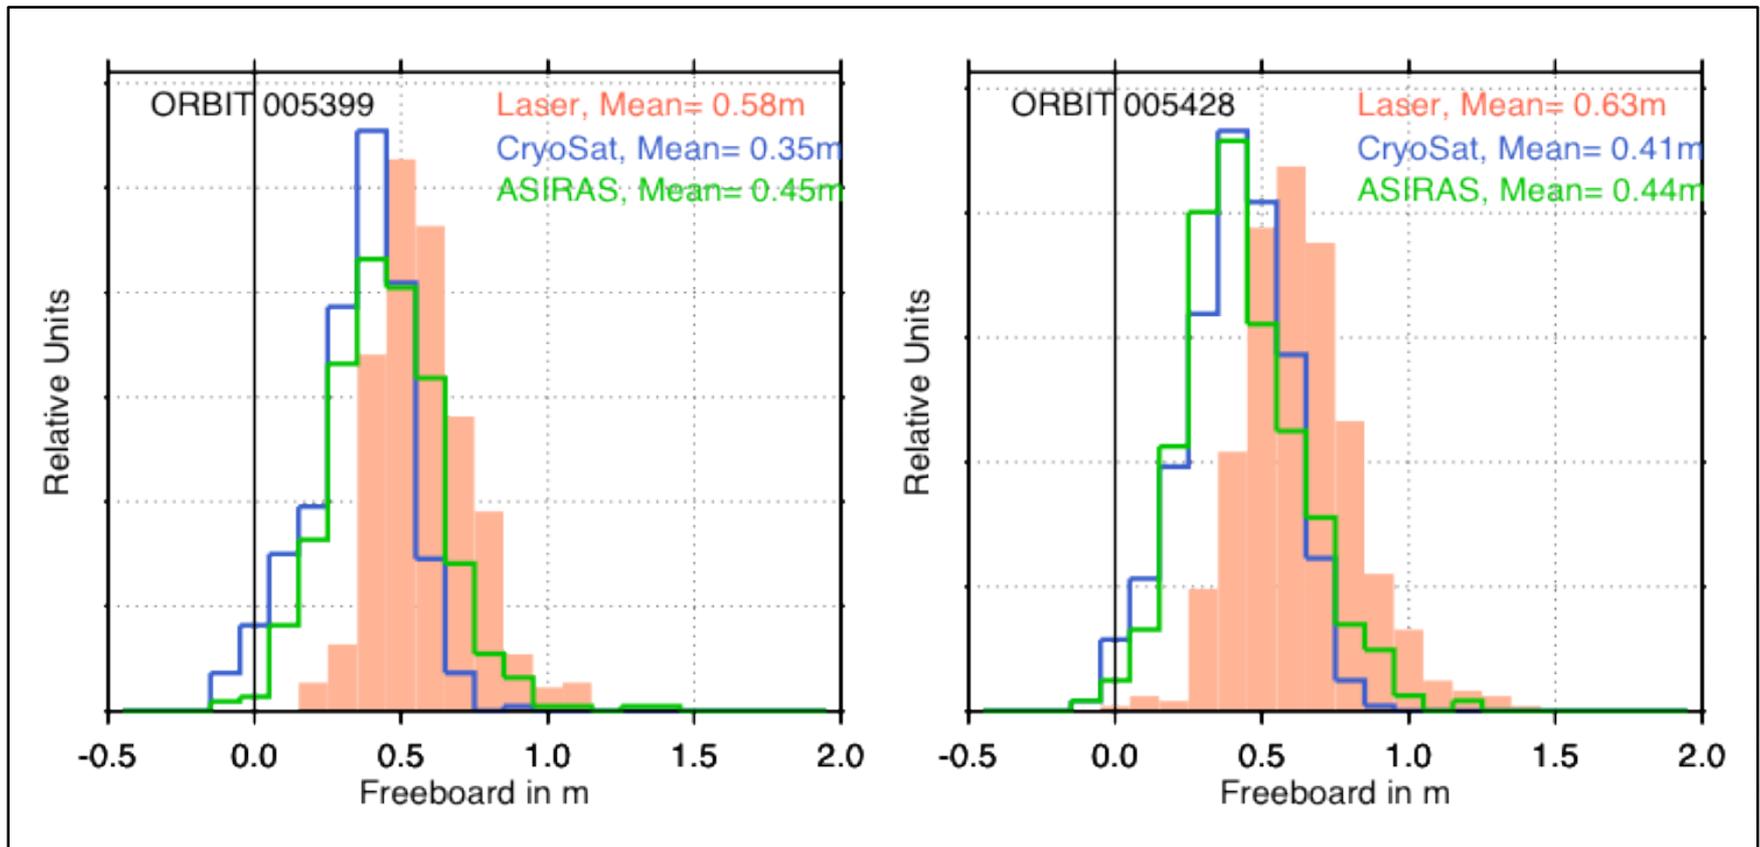

Polar-5

EM-Bird (direct sea ice thickness)
Airborne Laserscanner

CryoVEx 2011, April 2011

Freeboard: Airborne vs. CryoSat-2

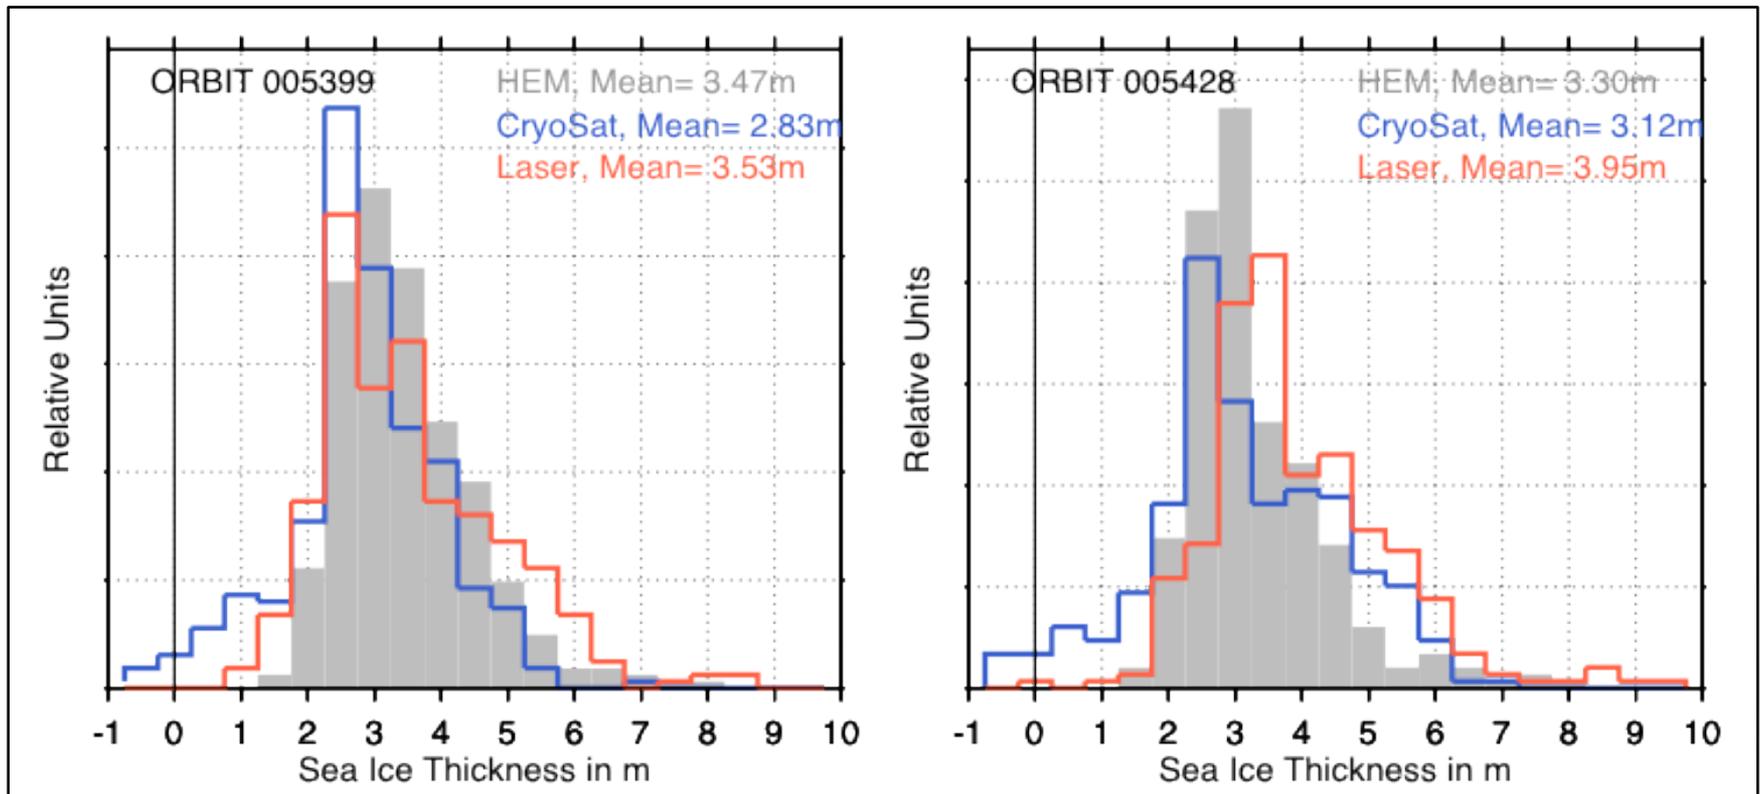

Airborne (laser & radar) and CryoSat-2 freeboard

Distribution of airborne radar and CryoSat-2 freeboard comparable

Difference to laser freeboard smaller than expected snow depth (even for dry & cold snow)

Thickness PDF: CryoSat-2 vs. EM-Bird

EM-Bird sea ice thickness and CryoSat-2 thickness

More scatter on ice thickness pdf of altimetry product than EM

Comparable mean values / EM-Bird data corrected for snow depth

Airborne EM sea ice thickness

Data in the Arctic since 2001

| Data overlap with all altimetry missions
Continued data acquisition

Calibration & Validation Results

radar freeboard \neq ice freeboard

| unknown spatial pattern of radar penetration

CryoVEx: good agreement of airborne and satellite freeboard & thickness

Remaining Issues

snow, snow, snow!

| knowledge of spatial & temporal distribution limits thickness accuracy

surface roughness

| planned forward model simulations

AWI CryoSat-2 sea ice product – Summary

AWI CryoSat-2 data

radar freeboard : in agreement with independent data sources

expected data availability : January – May (June) &
(September) October – December

updates and revisions on irregular basis

Goal: rapid-release data product in spring for sea ice prediction efforts
(model initialization)

Remaining Issues

Product currently has “beta” status | Release in the next weeks

Better uncertainty estimation required

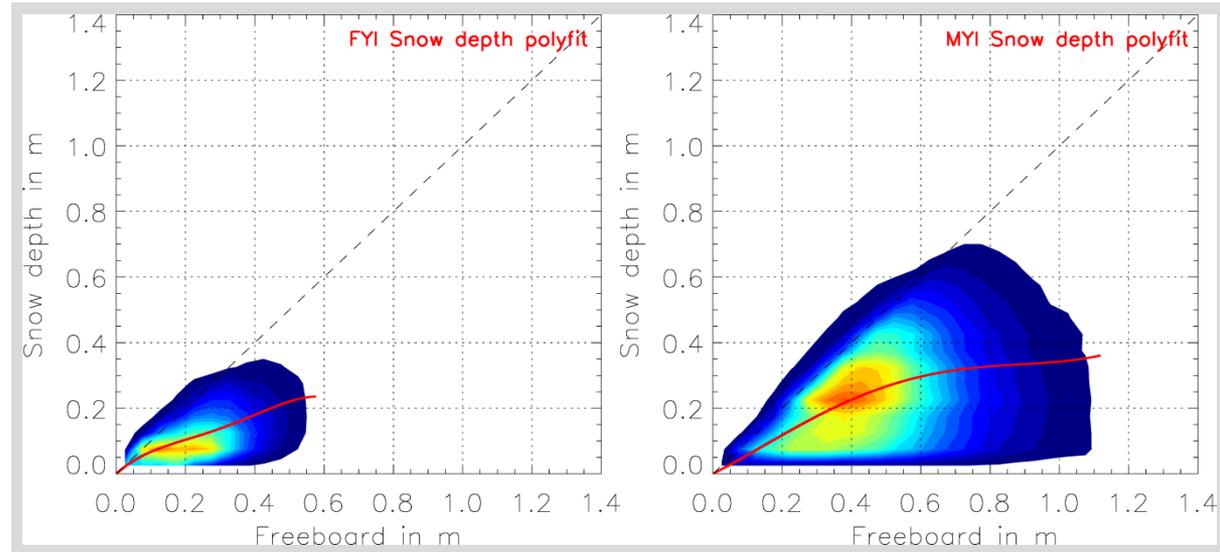

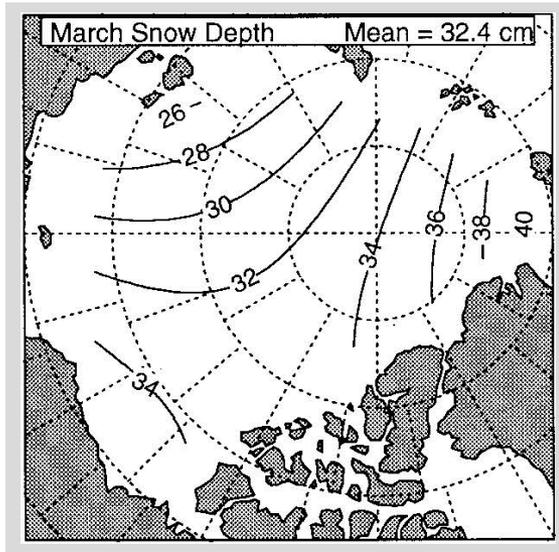

SARIn processing will be included

Better snow information needed

Thank You

Estimation of Snow Depth

Modified Climatology

Based on Warren et al. 1999

Factor 0.5 over FYI based on Operation IceBridge findings (Kurtz et al., 2009/2011)

IceBridge Probabilistic

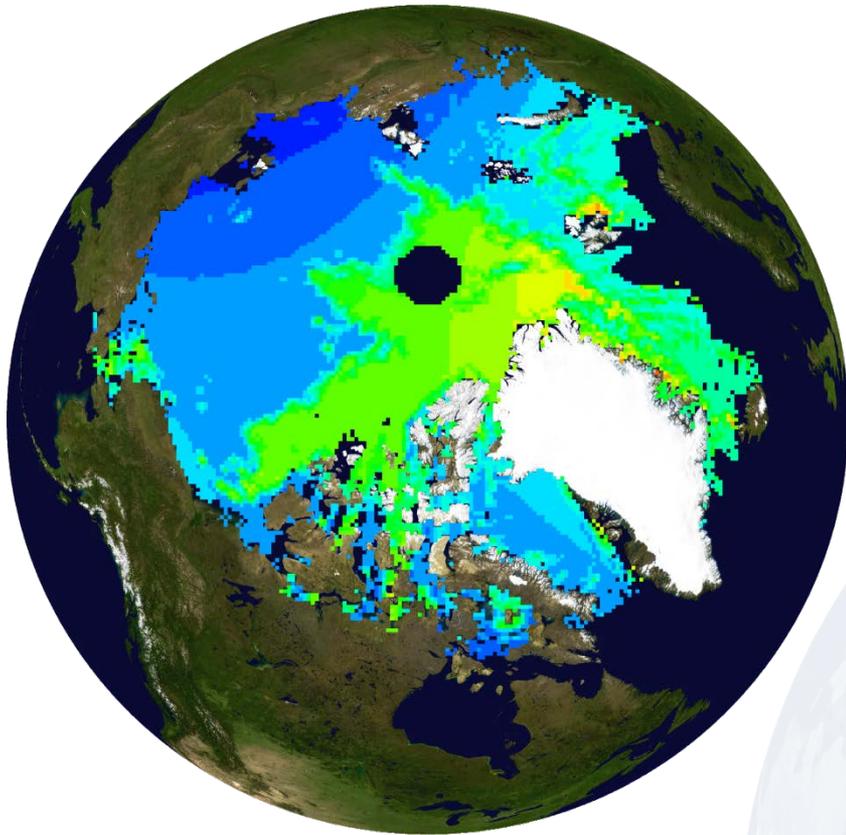

Based on fit laser freeboard and radar snow depth of Operation IceBridge data

► Snow depth directly related to freeboard

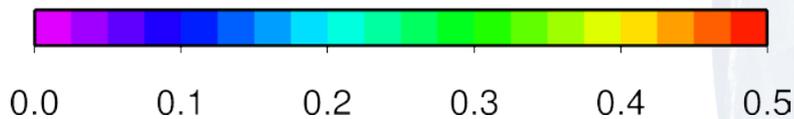

Might be only valid in spring and western Arctic
