1 Introduction

This report describes the processing of raw data acquired by position sensors on board RV Polarstern during expedition PS107 to receive a validated master track which is used as reference of further expedition data.

2 Workflow

The different steps of processing and validation are visualized in figure 1. Unvalidated data of up to three sensors and ship-motion data are extracted from the DAVIS SHIP data base (https://dship.awi.de) in a 1-second interval. They are converted to ESRI point shapefiles and imported to ArcGIS. A visual screening is performed to evaluate data quality and remove outliers manually. The position data from each position sensor are centered to the destined master track origin by applying ship-motion data (angles of roll, pitch and heading) and lever arms. For all three resulting position tracks, a quality check is performed using a ship’s speed filter and an acceleration filter. Filtered positions are flagged. In addition, a manual check is performed to flag obvious outliers. Those position tracks are combined to a single master track depending on a sensor priority list (by accuracy, reliability) and availability / applied exclusion of automatically or manually flagged of data. Missing data up to a time span of 60 seconds are linearly interpolated. To reduce the amount of points for overview maps the master track is generalized by using the Ramer-Douglas-Peucker algorithm. This algorithm returns only the most significant points from the track. Full master track and generalized master track are written to text files and imported to PANGAEA (http://www.pangaea.de) for publication.

Figure 1: Workflow of master track data processing
3 Sensor Layout

This chapter describes the position sensors mounted during this cruise.

Cruise details

Vessel name                RV Polarstern
Cruise name               PS107
Cruise start             2017-07-23 Tromsø
Cruise end               2017-08-19 Tromsø
Cruise duration         28 days

Master track reference point: Resulting master track is referenced to HYDRINS installation point.

Position sensors

<table>

Y Positive to starboard -5.460 m  
Z Positive upwards 21.525 m |
Sensor name: Trimble Marine SPS461 (2), short: Trimble 2
Description: DGPS-Receiver, correction type DGPS RTCM 2.x, correction source DGPS Base via radio
Accuracy: Horizontal: ± 0.25 m + 1 ppm & Vertical: ± 0.50 m + 1 ppm
Installation point: Observation deck (port)
Installation offset: Offset from master track reference point to sensor installation point
  X Positive to bow 16.527 m
  Y Positive to starboard 12.408 m
  Z Positive upwards 21.538 m

Motion sensor
Sensor name: iXBlue HYDRINS hydrographic survey INS, short: HYDRINS
Description: Marine inertial navigation system with reference positions from Trimble DGPS
Accuracy: ± 0.01 roll, ± 0.01 pitch, ± 0.01 heading (deg)
Installation point: Gravimeter room on F-Deck, close to COG

4 Processing Report

Database Extraction
Data source: DSHIP database (dship.awi.de)
Exported values: 2293199
First dataset: 2017-07-23T17:00:01 UTC
Last dataset: 2017-08-19T05:59:59 UTC

Centering & Motion Compensation
Each position track has been centered to the HYDRINS installation point by applying the corresponding motion angles for heading, roll and pitch as well as the installation offsets from chapter 3. The motion data were acquired by iXBlue HYDRINS hydrographic survey INS.

Automatic Validation
The following thresholds were applied for the automatic flagging of the position data:

Speed: Maximum 20 kn between two datapoints.
Acceleration: Maximum 1 m/s² between two datapoints.
Change of course: Maximum 5° between two datapoints.
Manual Validation

Obvious outliers were removed manually. For details see Processing Logbook of RV Polarstern (hdl:10013/epic.45909).

Master Track Generation

The master track is derived from the position sensors’ data selected by priority.

Sensor priority used:
1. HYDRINS
2. Trimble 1
3. Trimble 2

Filters applied: manual, speed, acceleration.

Distribution of position sensor data in master track:

<table>
<thead>
<tr>

</tbody>
</table>

Remarks

None.

Score

For each cruise, a score is calculated ranging from 0 (no data) to 100 (only very good data). The score for the cruise PS107 is 98.
Generalization

The master track is generalized to receive a reduced set of the most significant positions of the track using the Ramer-Douglas-Peucker algorithm and allow a maximum tolerated distance between points and generalized line of 4 arcseconds.
